

Constraint Satisfaction Problem

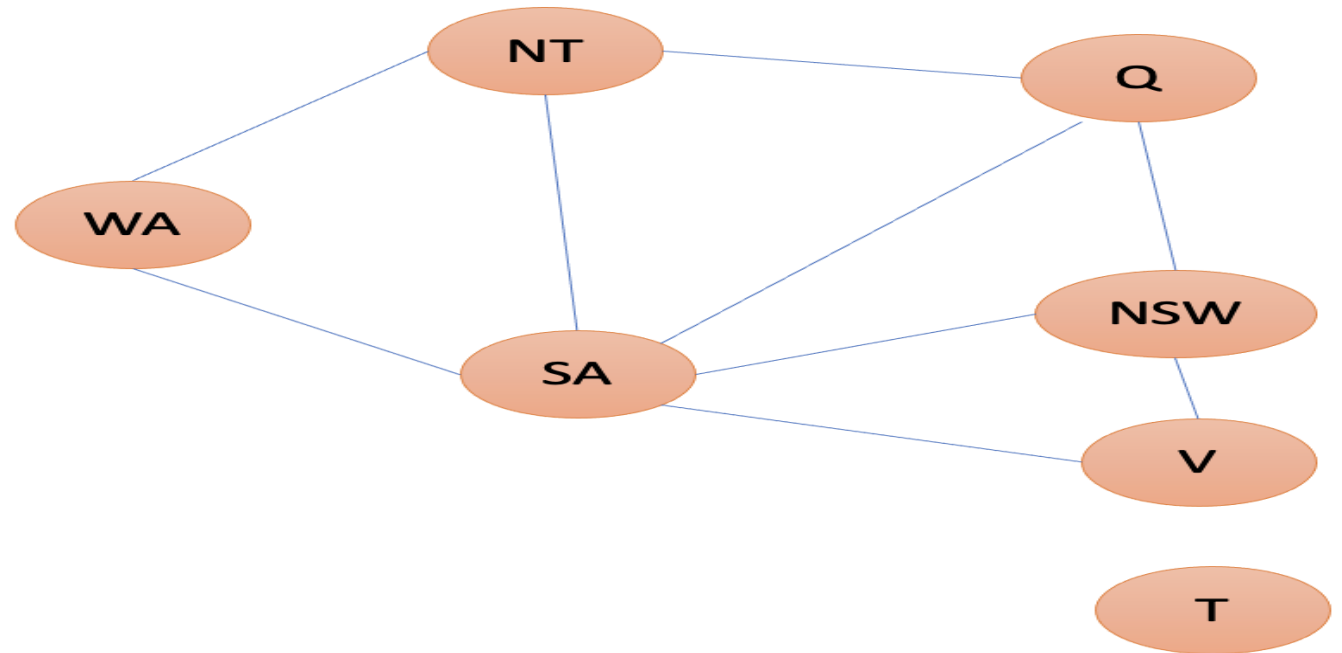

27/02/2024

Koustav Rudra

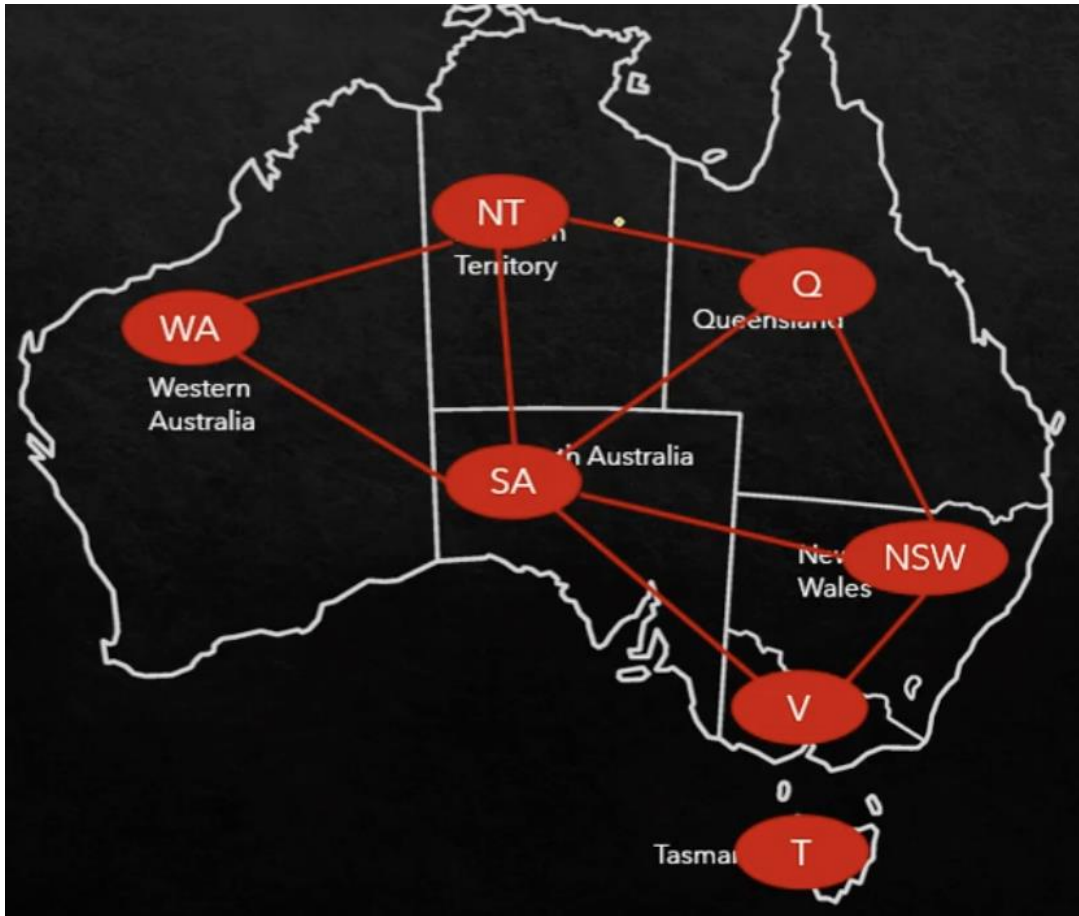

Example: Map Coloring

- Variables: {WA, NT, SA, Q, NSW, V, T}
- Domain: {blue, red, green}
- Constraint: Adjacent regions have different colour
 - $\{WA \neq NT\}$ or
 - $(WA, NT) \in \{(red, green), (red, blue), \dots\}$

Graphs as Abstraction Tool

Constraint Graph

Binary CSP:

- constraints involve at most two variables

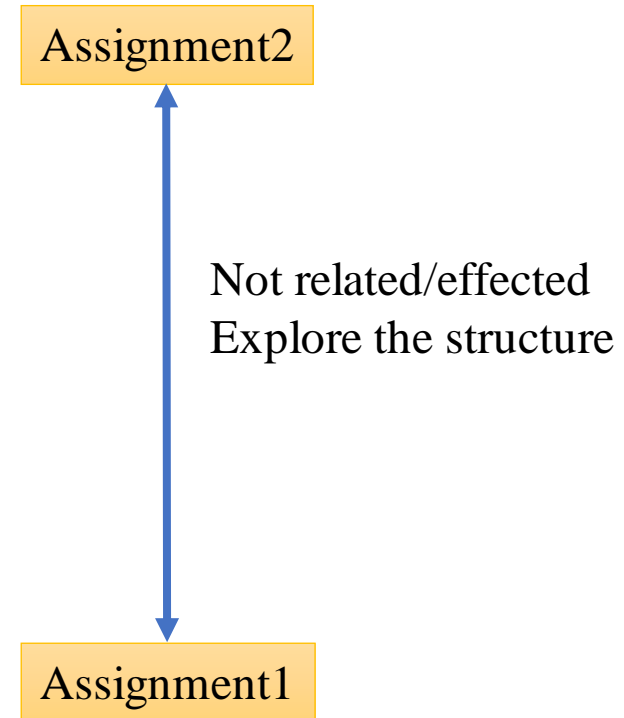

Binary Constraint Graph:

- Nodes \rightarrow Variables
- Arcs \rightarrow Constraints

- **Claim:** CSP algorithms with graph to speed up search
- **Generic solvers**
 - Abstraction through constraints

What is the big deal?

- CSP solver can prune a large region of the search space

CSP Variations: Variables

- Discrete variables
 - Finite domains
 - n variables, domain size $d \rightarrow O(d^n)$ complete assignments
 - Example: Boolean CSP, 3-SAT
 - Worst case: Exponential size
 - Infinite domains
 - Integer, string
 - Example: Job scheduling [start/end days for job]
 - Constraint Language: $\text{start job1} + 10 < \text{start job2}$
- Continuous variables
 - Start/End times of Hubble Space Telescope observations
 - Linear programming problems

CSP Variations: Constraints

- **Unary constraints – single variables**
 - $SA \neq \text{green}$
- **Binary constraints**
 - $SA \neq WA$
- **Higher order constraints – 3 or more variables**
 - Cryptarithmic
- **Soft Constraints**
 - Prof. A prefers to have classes in second half
 - Optimization + CSP
 - Every solution has some values [greater if preferences are kept]

CSP as Search Problem

- Initial State
 - Empty assignment $\{\}$
- Successor Function
 - Assign a value to any unassigned variable without conflict w.r.t previously assigned variables
- Goal Test
 - Current assignment complete?
- Path Cost
 - Constant cost for every step
- Incremental Formulation
 - Every solution appears at depth n if there are n variables
 - Search tree extends upto depth n
 - Depth first search algorithms for CSP

CSP: Search Methods

BFS

DFS

- No optimization
- Guaranteed to work as much as possible

Backtracking Search

- Do not proceed down if constraint is violated
- Backtracking search: Uninformed algorithm for CSP
- CSP is commutative
 - Order of actions does not affect the outcome
 - [SA=red then Q=green] same as [Q=green then SA=red]
- CSP can also generate successors by considering assignment for a single variable (Independence)
 - d^n unique values
- Check constraints on the go

Backtracking Search

- **Expand**
 - Pick a single variable to expand
 - Iterate over domain value
- **Process one children**
 - One children per value
- **Backtrack**
 - Conflicting assignment

Backtracking Search

- function **BACKTRACKING-SEARCH**(csp) return solution/failure
 - return **RECURSIVE-BACKTRACKING**({ },csp)
- function **RECURSIVE-BACKTRACKING**(assignment, csp) return sol/fail
 - if assignment is complete then return assignment
 - var ← **SELECT-UNASSIGNED-VARIABLE**(**VARIABLES**[csp], assignment, csp)
 - for each value in **ORDER-DOMAIN-VALUE**(var, assignment, csp) do
 - if value is consistent with assignment given **CONSTRAINTS**[csp] then
 - add {var=value} to assignment
 - result ← **RECURSIVE-BACKTRACKING**(assignment, csp)
 - if result ≠ failure then return result
 - remove {var=value} from assignment
 - return failure

Backtracking = DFS + Variable ordering + Fail on conflict

https://www.cs.cmu.edu/~15281-s20/demos/csp_backtracking/

Making Backtracking more efficient

- General uninformed search facilitates huge speed gain

- **Ordering**

- Which variable to assigned next?
 - What would be the order of values?

- **Filter**

- Can we detect failures early?

- Can we exploit problem structure?

Domain Independent

Backtracking Search: Filtering

- **Filtering:** Take stock of the unassigned variables and filter out the bad options
- **Forward checking:** Cross off values that violate a constraint when added to existing a:

WA	NT	Q	NSW	V	SA
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>

<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>

Constraint Propagation

27/02/2024

Koustav Rudra

Constraint Propagation: Arc Consistency

- An arc $X \rightarrow Y$ is consistent iff $\forall x$ in the tail $\exists y$ in the head which could be assigned without violating any constraint

- Is $NT \rightarrow WA$ consistent?
 - No
 - For NT (RED) there is no options for WA
- How to make it consistent?
 - Delete RED from NT set
- Is $Q \rightarrow WA$ consistent?
 - Yes

Forward checking: Enforcing consistency of arcs pointing to each new assignment

Arc consistency of CSP

- A CSP is consistent iff all the arcs are consistent

WA	NT	Q	NSW	V	SA
					

If a variable X loses a value, neighbors of X should be rechecked

Arc consistency detects failure before forward checking

- Is $V \rightarrow NSW$ consistent?
 - (Red, Blue), (Green, Blue), (Blue, Red)
- Is $SA \rightarrow NSW$ consistent?
 - (Blue, Red)
- Is $NSW \rightarrow SA$ consistent?
 - (Blue, ---)

Change in one variable affects the other
Constraints get propagated

- How to make $NSW \rightarrow SA$ consistent?
 - Remove blue from NSW
 - Always delete from the tail
- Is $V \rightarrow NSW$ consistent?
 - (Red, ---)

Arc consistency of CSP

- function AC-3(csp) returns CSP with reduced (possibly) domains
 - queue \leftarrow All the arcs in csp
 - while queue is not empty do
 - $(X_i, X_j) \leftarrow \text{REMOVE-FIRST}(\text{queue})$
 - if $\text{REMOVE-INCONSISTENT-VALUES}(X_i, X_j)$ then
 - for each X_k in $\text{NEIGHBORS}[X_i]$ do
 - add(X_k, X_i) to queue
- function $\text{REMOVE-INCONSISTENT-VALUES}(X_i, X_j)$ returns true if succeeds
 - removed \leftarrow False
 - for each x in $\text{DOMAIN}[X_i]$ do
 - If no value y in $\text{DOMAIN}[X_j]$ allows (x,y) to satisfy the constraint $X_i \rightarrow X_j$ then
 - Delete x from $\text{DOMAIN}[X_i]$
 - removed \leftarrow true
 - return removed

Complexity: $O(n^2 d^3)$

Each node has limited number of assignments

Arc Consistency: Limitations

- After enforcing arc consistency
 - Can have one solution left
 - Can have multiple solution left
 - Can have no solution left (unaware)

Filtering

27/02/2024

Koustav Rudra

Ordering: Minimum Remaining Value

- Choose the variable to expand that has fewest legal values left in its domain:
 - Most constrained variable
 - $X1 = [R, G, B]$ $X2 = [B]$

WA	NT	Q	NSW	V	SA
<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>
<div><div></div></div>	<div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div></div>
<div><div></div></div>	<div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div></div>
<div><div></div></div>	<div><div></div></div>	<div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div><div></div></div>	<div><div></div><div></div></div>

Most Constraint Variable or Fail-Fast ordering

Ordering: Least Constraining Values (LCV)

- Choose the value of a variable that rules out the fewest values in the remaining variables

CSPs: Recap

- CSP Structure
 - Variables
 - Domains
 - Constraints
 - Implicit (code to compute)
 - Explicit (list of legal tuples)
 - Unary / Binary / n-ary
- Goals
 - Find any solution
 - Find optimal solution

CSP Solver

- Backtracking give huge gain in speed
- Ordering
 - Which variable should be processed next (MRV)?
 - In what order values of the chosen variable be tried (LCV)?
- Filtering
 - Can we detect eventual failure early?
 - Arc consistency
- Structure
 - Can we exploit the problem structure?

NP-hard

Thank You
