Resolution Refutation Proof

06/02/2024

Koustav Rudra

Procedure for Resolution

- Convert the set of rules and facts into clause form (conjunction of clauses)
- Insert the negation of the goal as another clause
- Use resolution to deduce a refutation
- If the refutation is obtained then the goal can be deduced from the set of facts and rules
- $\varphi : F1 \wedge F2 \wedge \dots \wedge F_n \rightarrow G$
- $\varphi : \sim(F1 \wedge F2 \wedge \dots \wedge F_n) \vee G \longrightarrow \text{Valid}$
- $\sim\varphi : F1 \wedge F2 \wedge \dots \wedge F_n \wedge \sim G \longrightarrow \text{Unsatisfiable}$

Resolution

- If $\text{Unify}(z_j, \sim q_k) = \theta$
- $z_1 \vee \dots \vee z_m, q_1 \vee \dots \vee q_n$
- $\text{SUBST}(\theta, z_1 \vee \dots \vee z_{i-1} \vee z_{i-1} \dots \vee z_m \vee q_1 \vee \dots \vee q_{k-1} \vee q_{k+1} \dots \vee q_n)$

Example

- Akash, Amit, and Arun are students of a school
- Every student is either wicked or is a good Cricket player, or both
- No Cricket player likes rain and all wicked students like potions
- Arun dislikes whatever Akash likes and likes whatever Akash dislikes
- Arun likes rain and potions
- Is there anyone who is good in Cricket but not in potions?

Representation in Predicate Logic

- Akash, Amit, and Arun are students of a school
 - C1: Student(Akash)
 - C2: Student(Amit)
 - C3: Student(Arun)
- Every student is either wicked or is a good Cricket player, or both
 - $\forall_x \text{Student}(x) \rightarrow \text{Wicked}(x) \vee \text{Cricket}(x)$
 - C4: $\sim \text{Student}(x) \vee \text{Wicked}(x) \vee \text{Cricket}(x)$

Representation in Predicate Logic

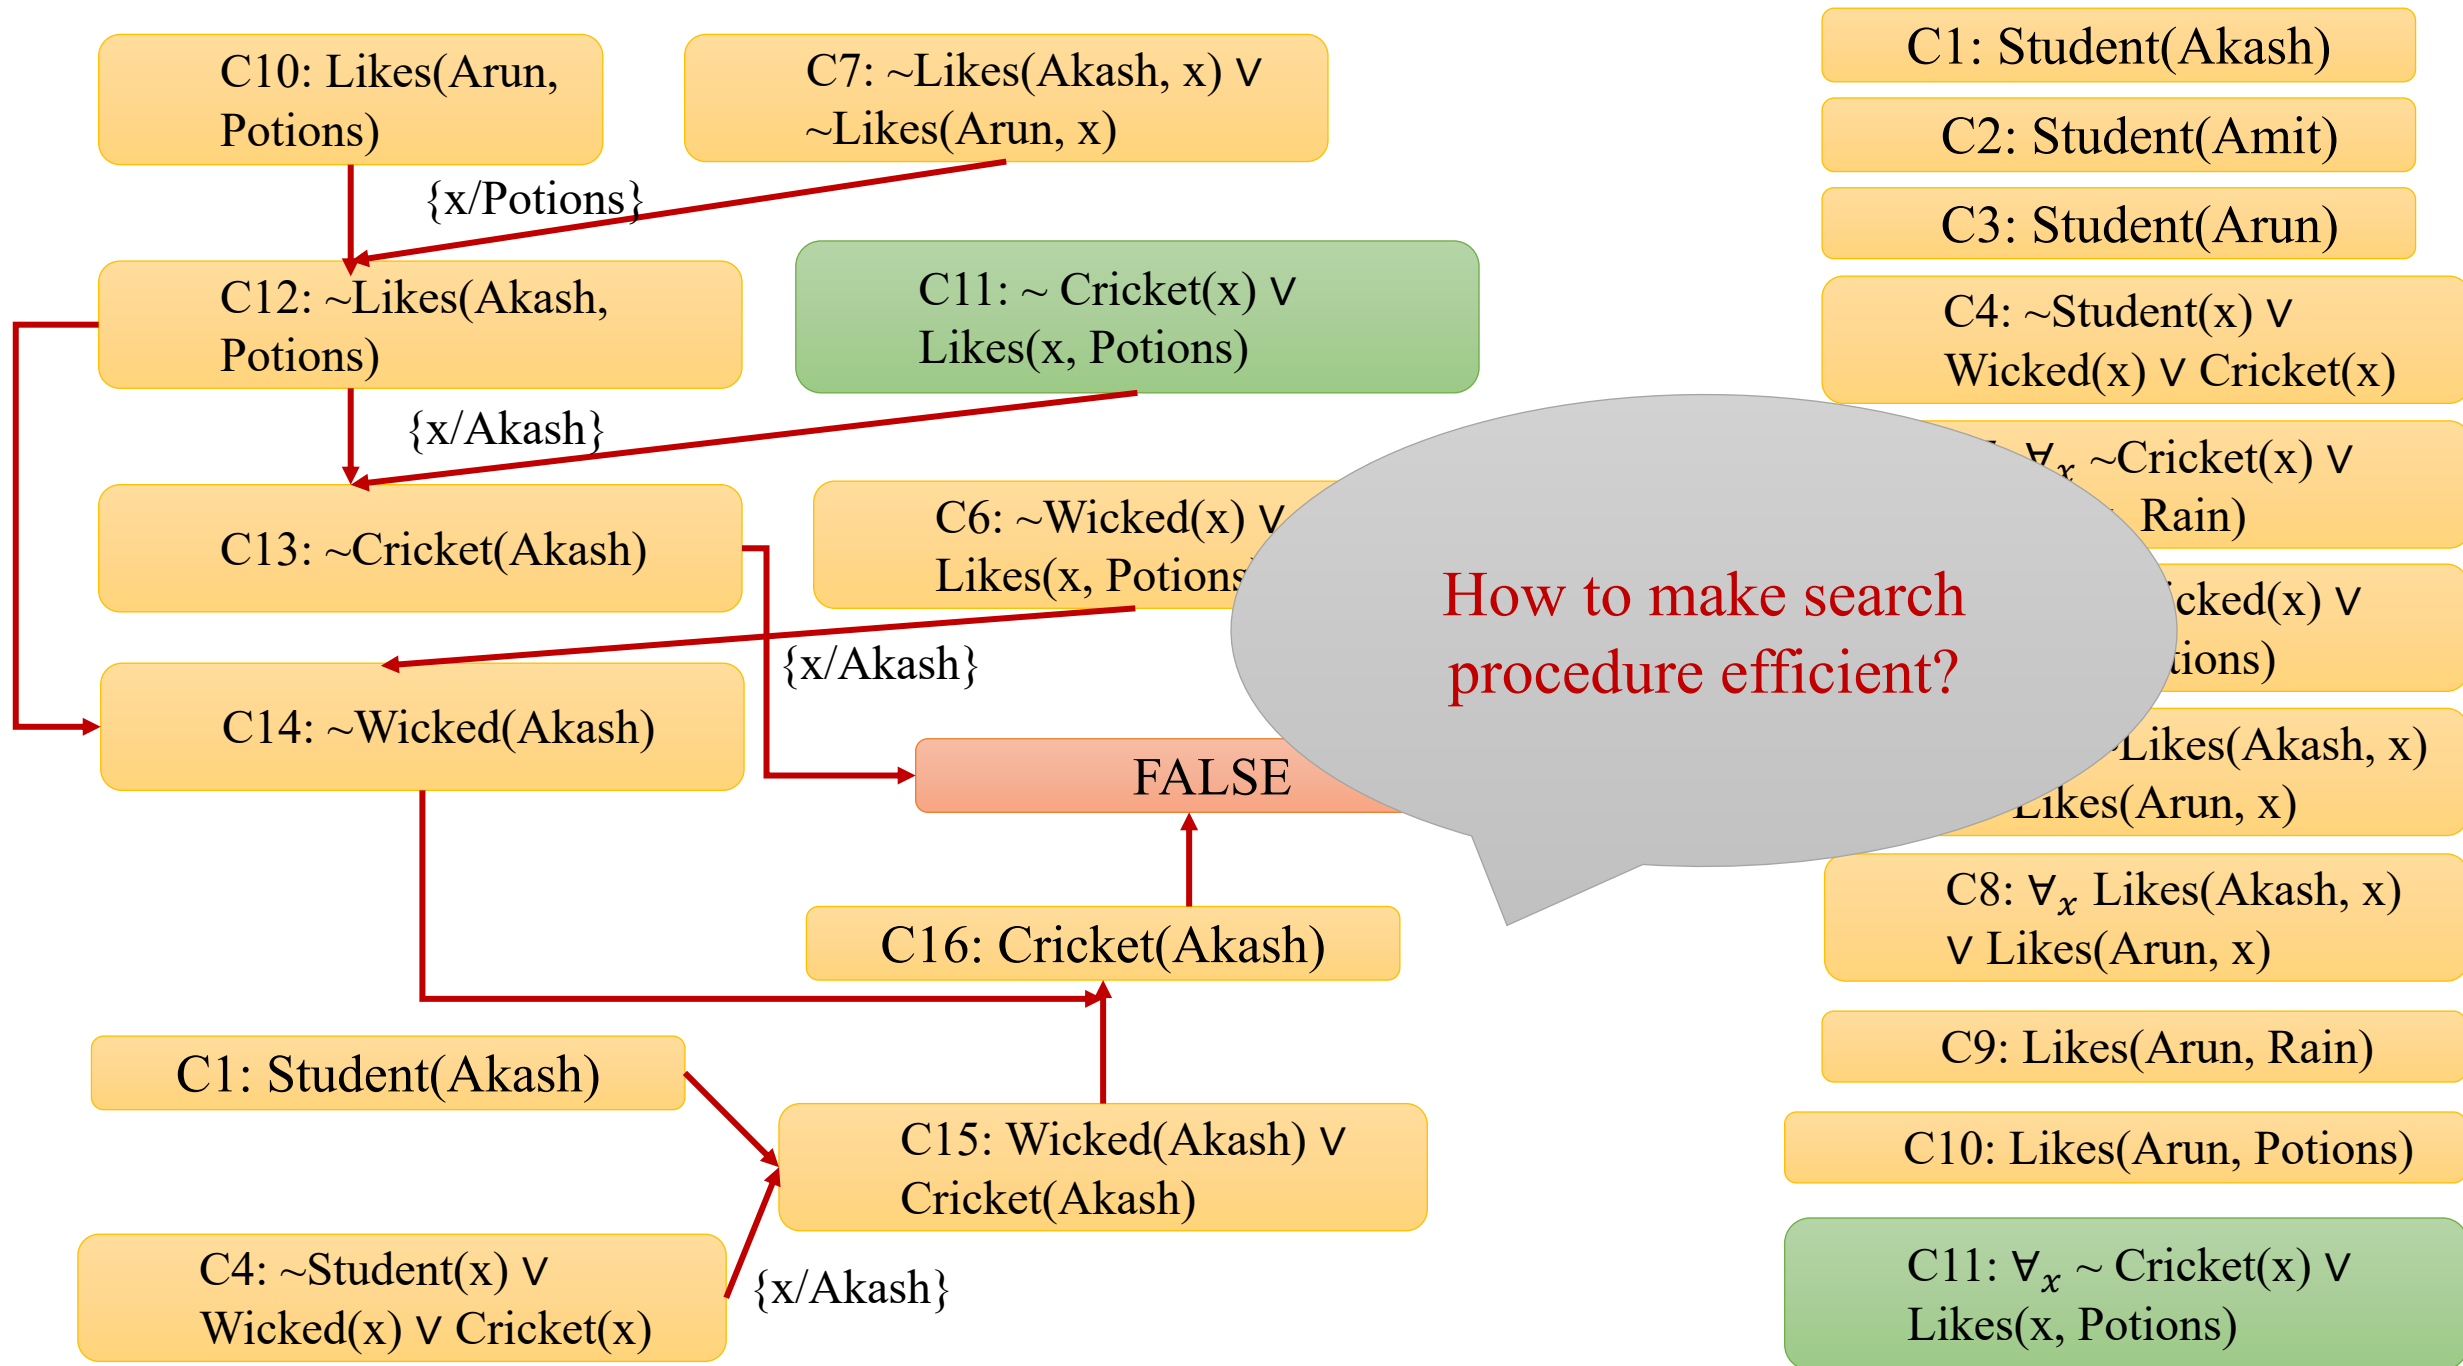

- No Cricket player likes rain and all wicked students like potions
 - $\forall_x \text{Cricket}(x) \rightarrow \sim \text{Likes}(x, \text{Rain})$
 - $\forall_x \text{Wicked}(x) \rightarrow \text{Likes}(x, \text{Potions})$
 - C5: $\forall_x \sim \text{Cricket}(x) \vee \sim \text{Likes}(x, \text{Rain})$
 - C6: $\forall_x \sim \text{Wicked}(x) \vee \text{Likes}(x, \text{Potions})$

Representation in Predicate Logic

- Arun dislikes whatever Akash likes and likes whatever Akash dislikes
 - $\forall_x \text{Likes}(\text{Akash}, x) \Leftrightarrow \sim \text{Likes}(\text{Arun}, x)$
 - $\forall_x [\text{Likes}(\text{Akash}, x) \rightarrow \sim \text{Likes}(\text{Arun}, x)] \wedge [\sim \text{Likes}(\text{Arun}, x) \rightarrow \text{Likes}(\text{Akash}, x)]$
 - C7: $\forall_x \sim \text{Likes}(\text{Akash}, x) \vee \sim \text{Likes}(\text{Arun}, x)$
 - C8: $\forall_x \text{Likes}(\text{Akash}, x) \vee \text{Likes}(\text{Arun}, x)$
- Arun likes rain and potions
 - C9: $\text{Likes}(\text{Arun}, \text{Rain})$
 - C10: $\text{Likes}(\text{Arun}, \text{Potions})$

Representation in Predicate Logic

- Is there anyone who is good in Cricket but not in potions?
 - G: $\exists_x \text{Cricket}(x) \wedge \sim \text{Likes}(x, \text{Potions})$
 - $\sim G$: $\forall_x \sim \text{Cricket}(x) \vee \text{Likes}(x, \text{Potions})$
 - C11: $\forall_x \sim \text{Cricket}(x) \vee \text{Likes}(x, \text{Potions})$

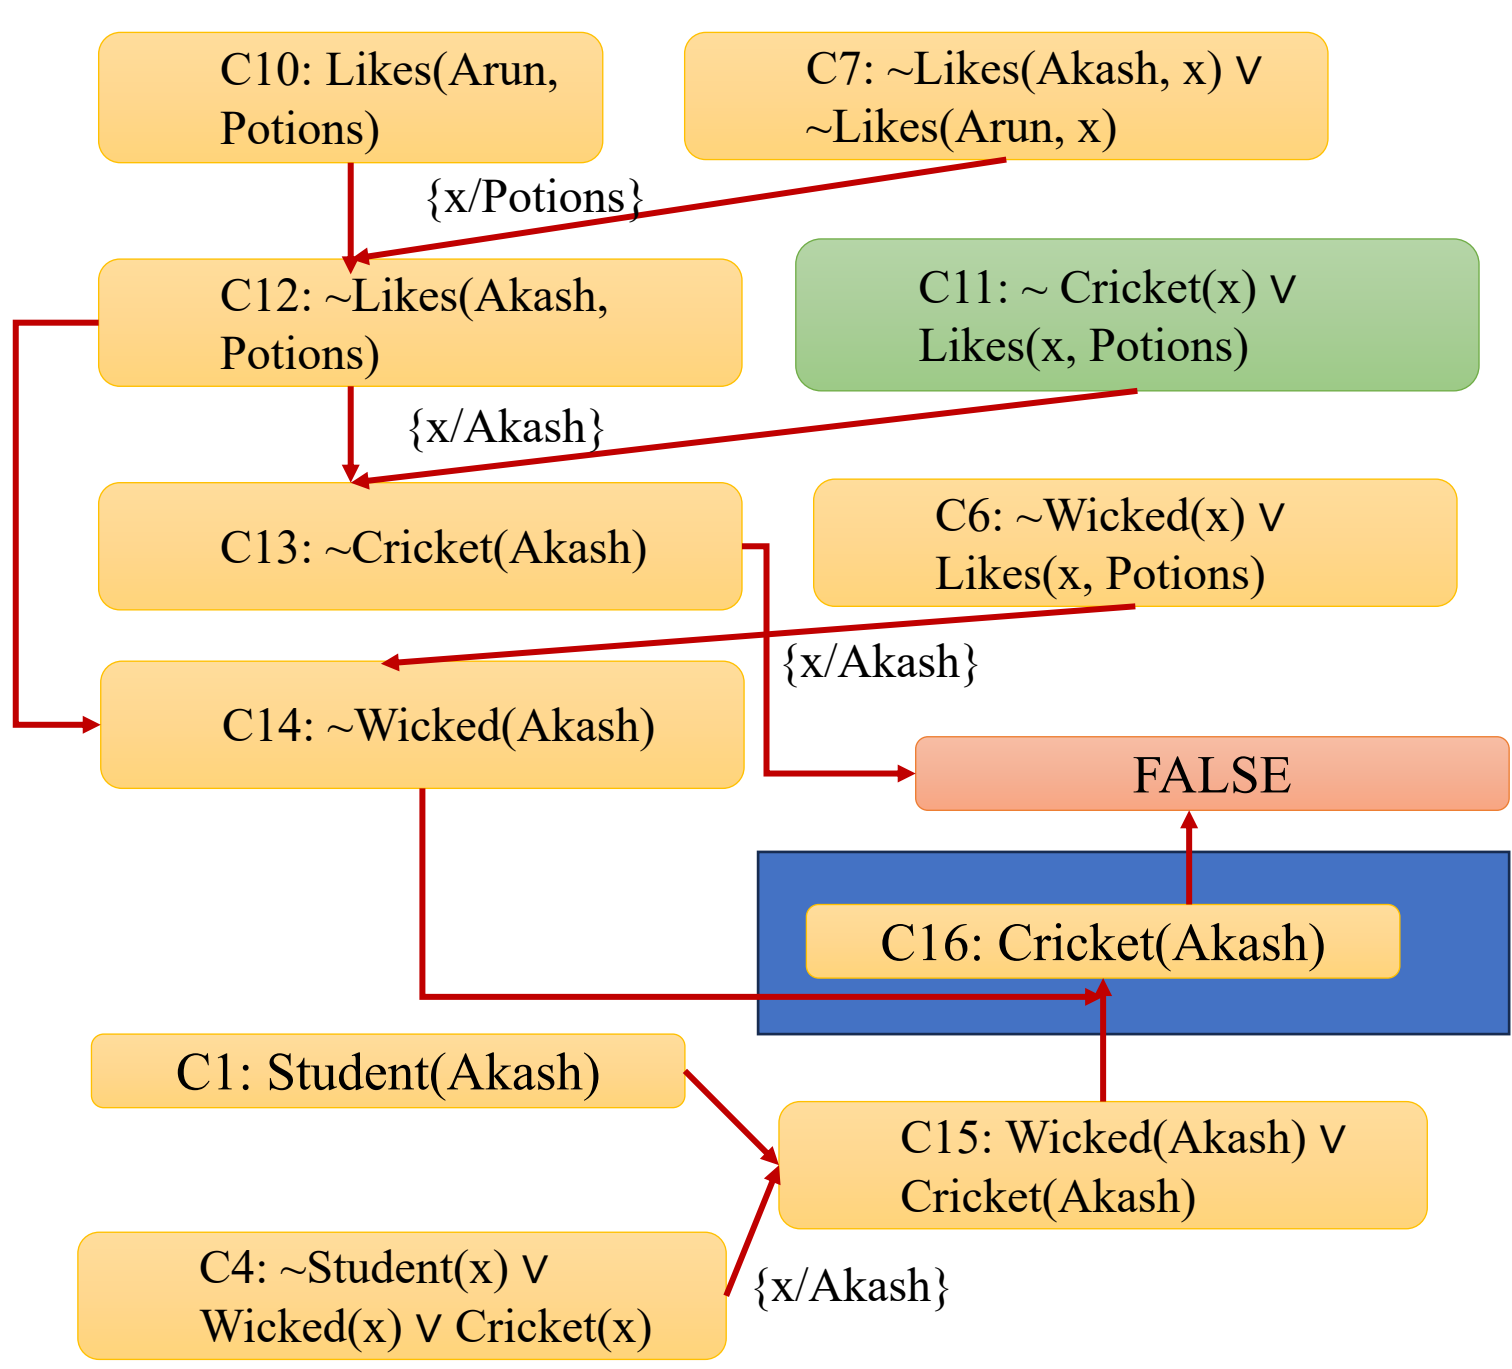

Resolution Refutation Strategies

Resolution Strategies

- Unit Resolution
 - Every resolution step must involve a unit clause
- Unit clause
 - A clause that does not have any OR
 - It just has one predicate or its negation
- Leads to a good speedup
- Incomplete in general
 - There might be cases that can't be deduced using unit resolution but can be deduced using other resolution methods
- Complete for Horn knowledge bases

Resolution Strategies

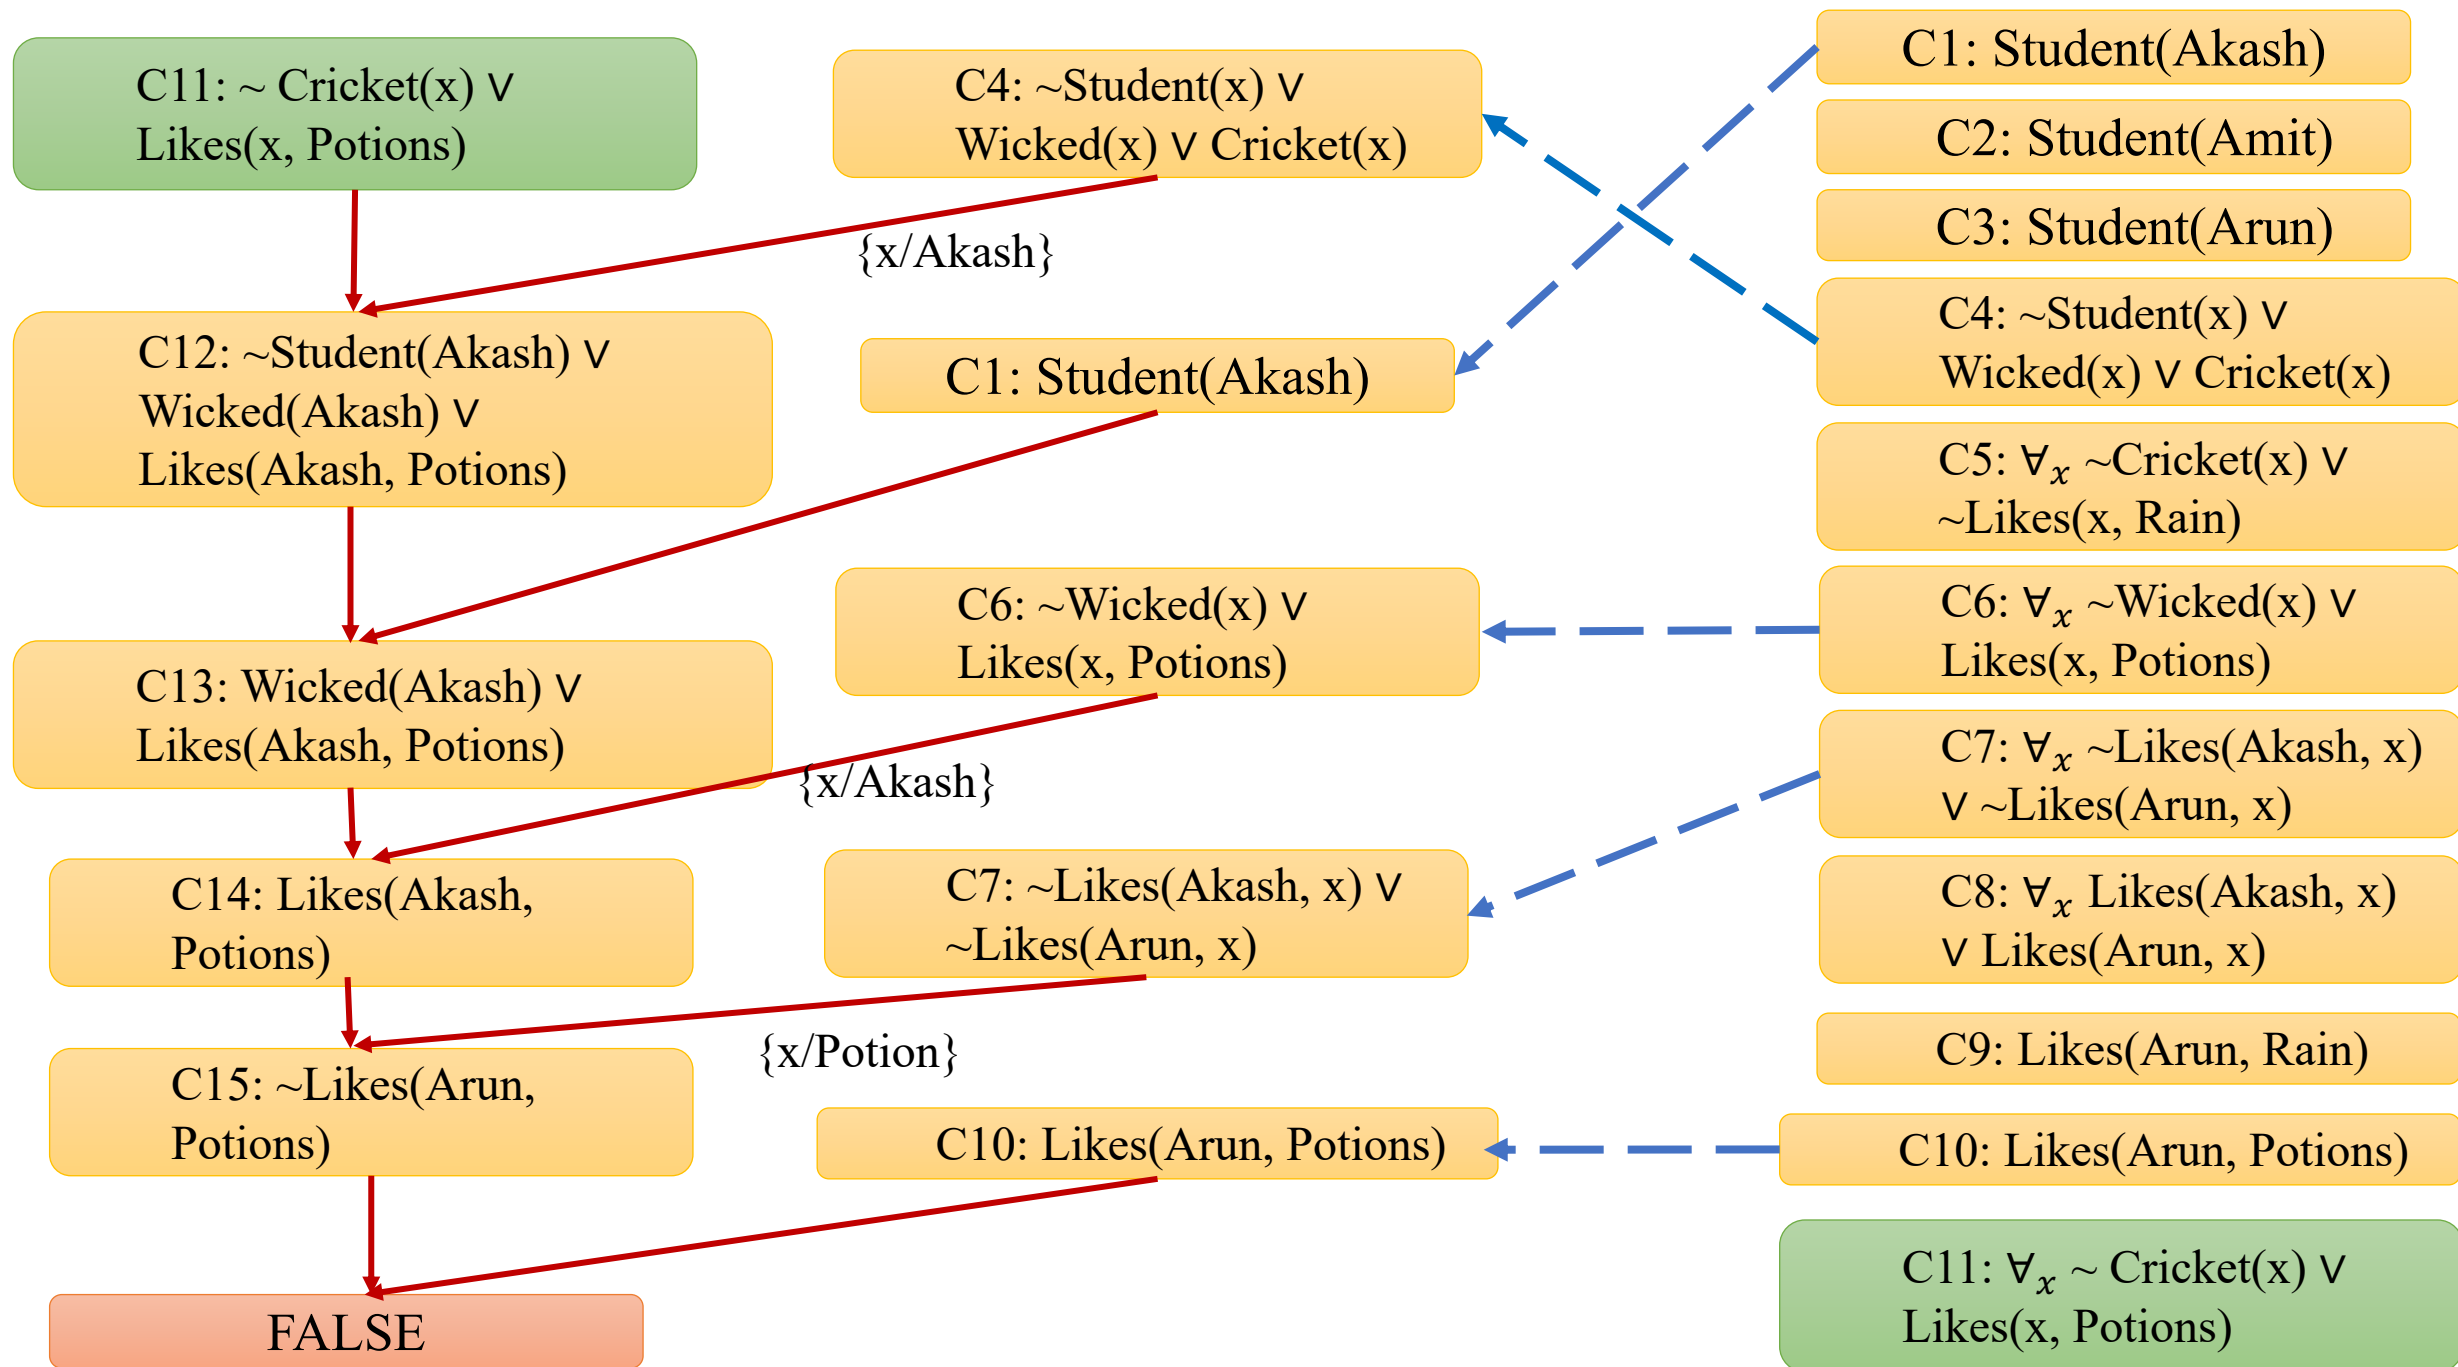

- Input Resolution
 - Every resolution step must involve an input sentence (from the query or KB)
 - All can't be derived clauses
- In Horn knowledge bases, Modus Ponens is a kind of input resolution strategy
- Incomplete in general
- Complete for Horn knowledge bases

- $C1: Student(Akash)$
- $C2: Student(Amit)$
- $C3: Student(Arun)$
- $C4: \sim Student(x) \vee Wicked(x) \vee Cricket(x)$
- $C5: \forall x \sim Cricket(x) \vee \sim Likes(x, Rain)$
- $C6: \forall x \sim Wicked(x) \vee Likes(x, Potions)$
- $C7: \forall x \sim Likes(Akash, x) \vee \sim Likes(Arun, x)$
- $C8: \forall x Likes(Akash, x) \vee Likes(Arun, x)$
- $C9: Likes(Arun, Rain)$
- $C10: Likes(Arun, Potions)$
- $C11: \forall x \sim Cricket(x) \vee Likes(x, Potions)$

Resolution Strategies

- Linear Resolution
 - Slight generalization of input resolution
 - Allows P and Q to be resolved together either
 - if P is in the original KB, or
 - if P is an ancestor of Q in the proof tree
- Linear resolution is complete

What is Deduction?

- Deduction is also a kind of search
- We have to search within the rules, facts, and clauses
- Find them in appropriate order in which to apply them to deduce clauses and goals

Logic Programming: Prolog

06/02/2024

Koustav Rudra

Objective

- How to write programs using Prolog?
- Tools:
 - GNU Prolog
 - SWI Prolog

Language Choice

- “Known” languages like FORTRAN, C/C++, Java, python
 - **Imperative:** How-type language
- Goal Oriented Languages (Declarative)
 - **Declarative:** What-type language
 - LISP
 - ProLog: Truly what-type language

Imperative vs Declarative

Programming languages

- **Imperative:** Comprises a sequence of commands
- **Declarative:** Declare what result we want and leave the language to come up with the procedure to produce them

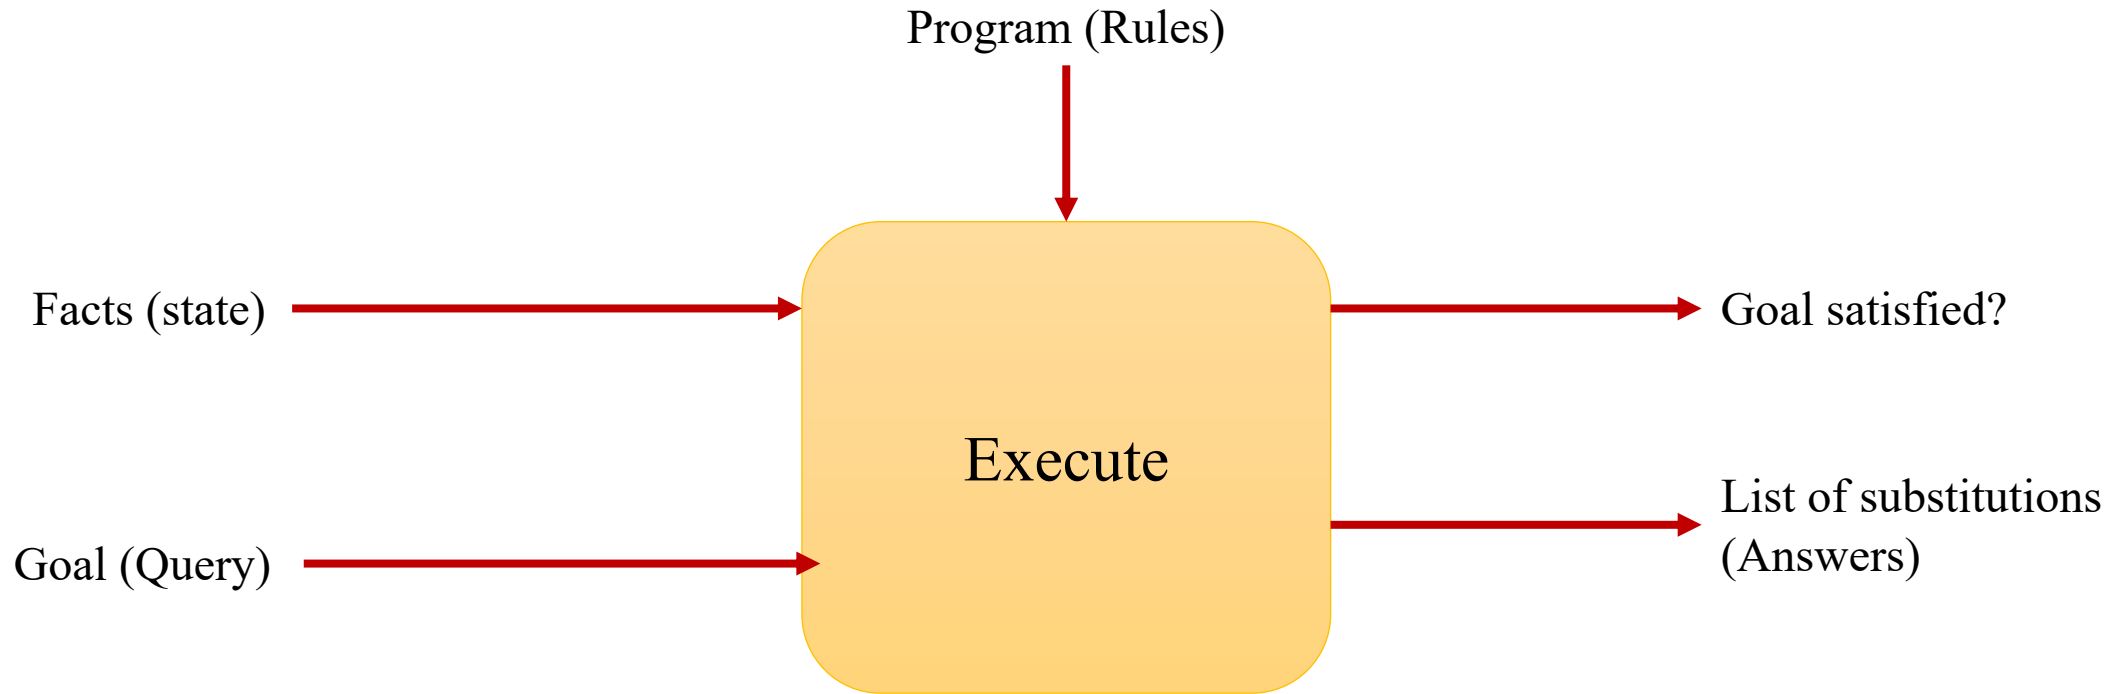

Prolog and FOL

- Prolog Language Syntax
 - Horn clause
 - $F1 \wedge F2 \dots F_n \rightarrow G$
 - $\text{child}(x) \wedge \text{male}(x) \rightarrow \text{boy}(x)$
- Prolog proof procedure
 - Resolution Principle
- Prolog goal matching
 - Unification and substitution

How to specify rule?

- $\text{child}(x) \wedge \text{male}(x) \rightarrow \text{boy}(x)$
- $\text{boy}(x) \text{ :- child}(x), \text{male}(x)$

Prolog Computation Model

Prolog

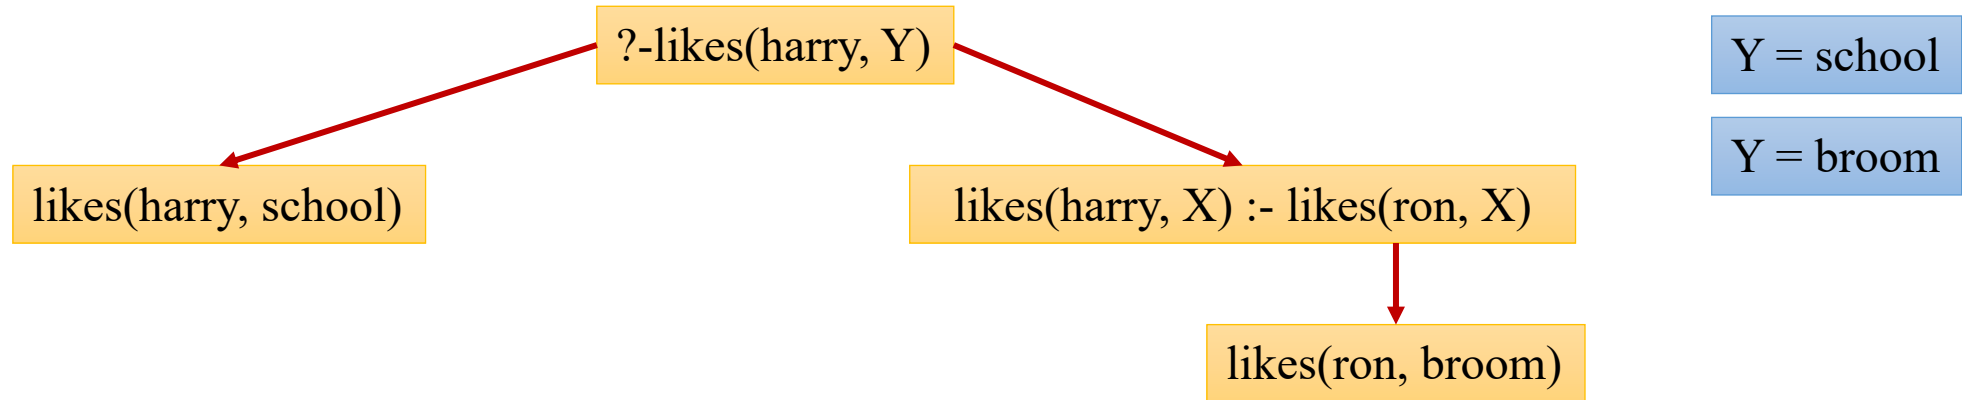

- Declarative language
 - Don't have to specify how a program should execute
 - Just declare what you want to do

Basics

- The notion of instantiation
 - likes(harry, school).
 - likes(ron, broom).
 - likes(harry, X) :- likes(ron, X). [likes(ron, X) \rightarrow likes(harry, X)]
 - In order to deduce what harry likes we have to deduce first what ron likes
- Consider following goals:
 - ?-likes(harry,broom)

Solution

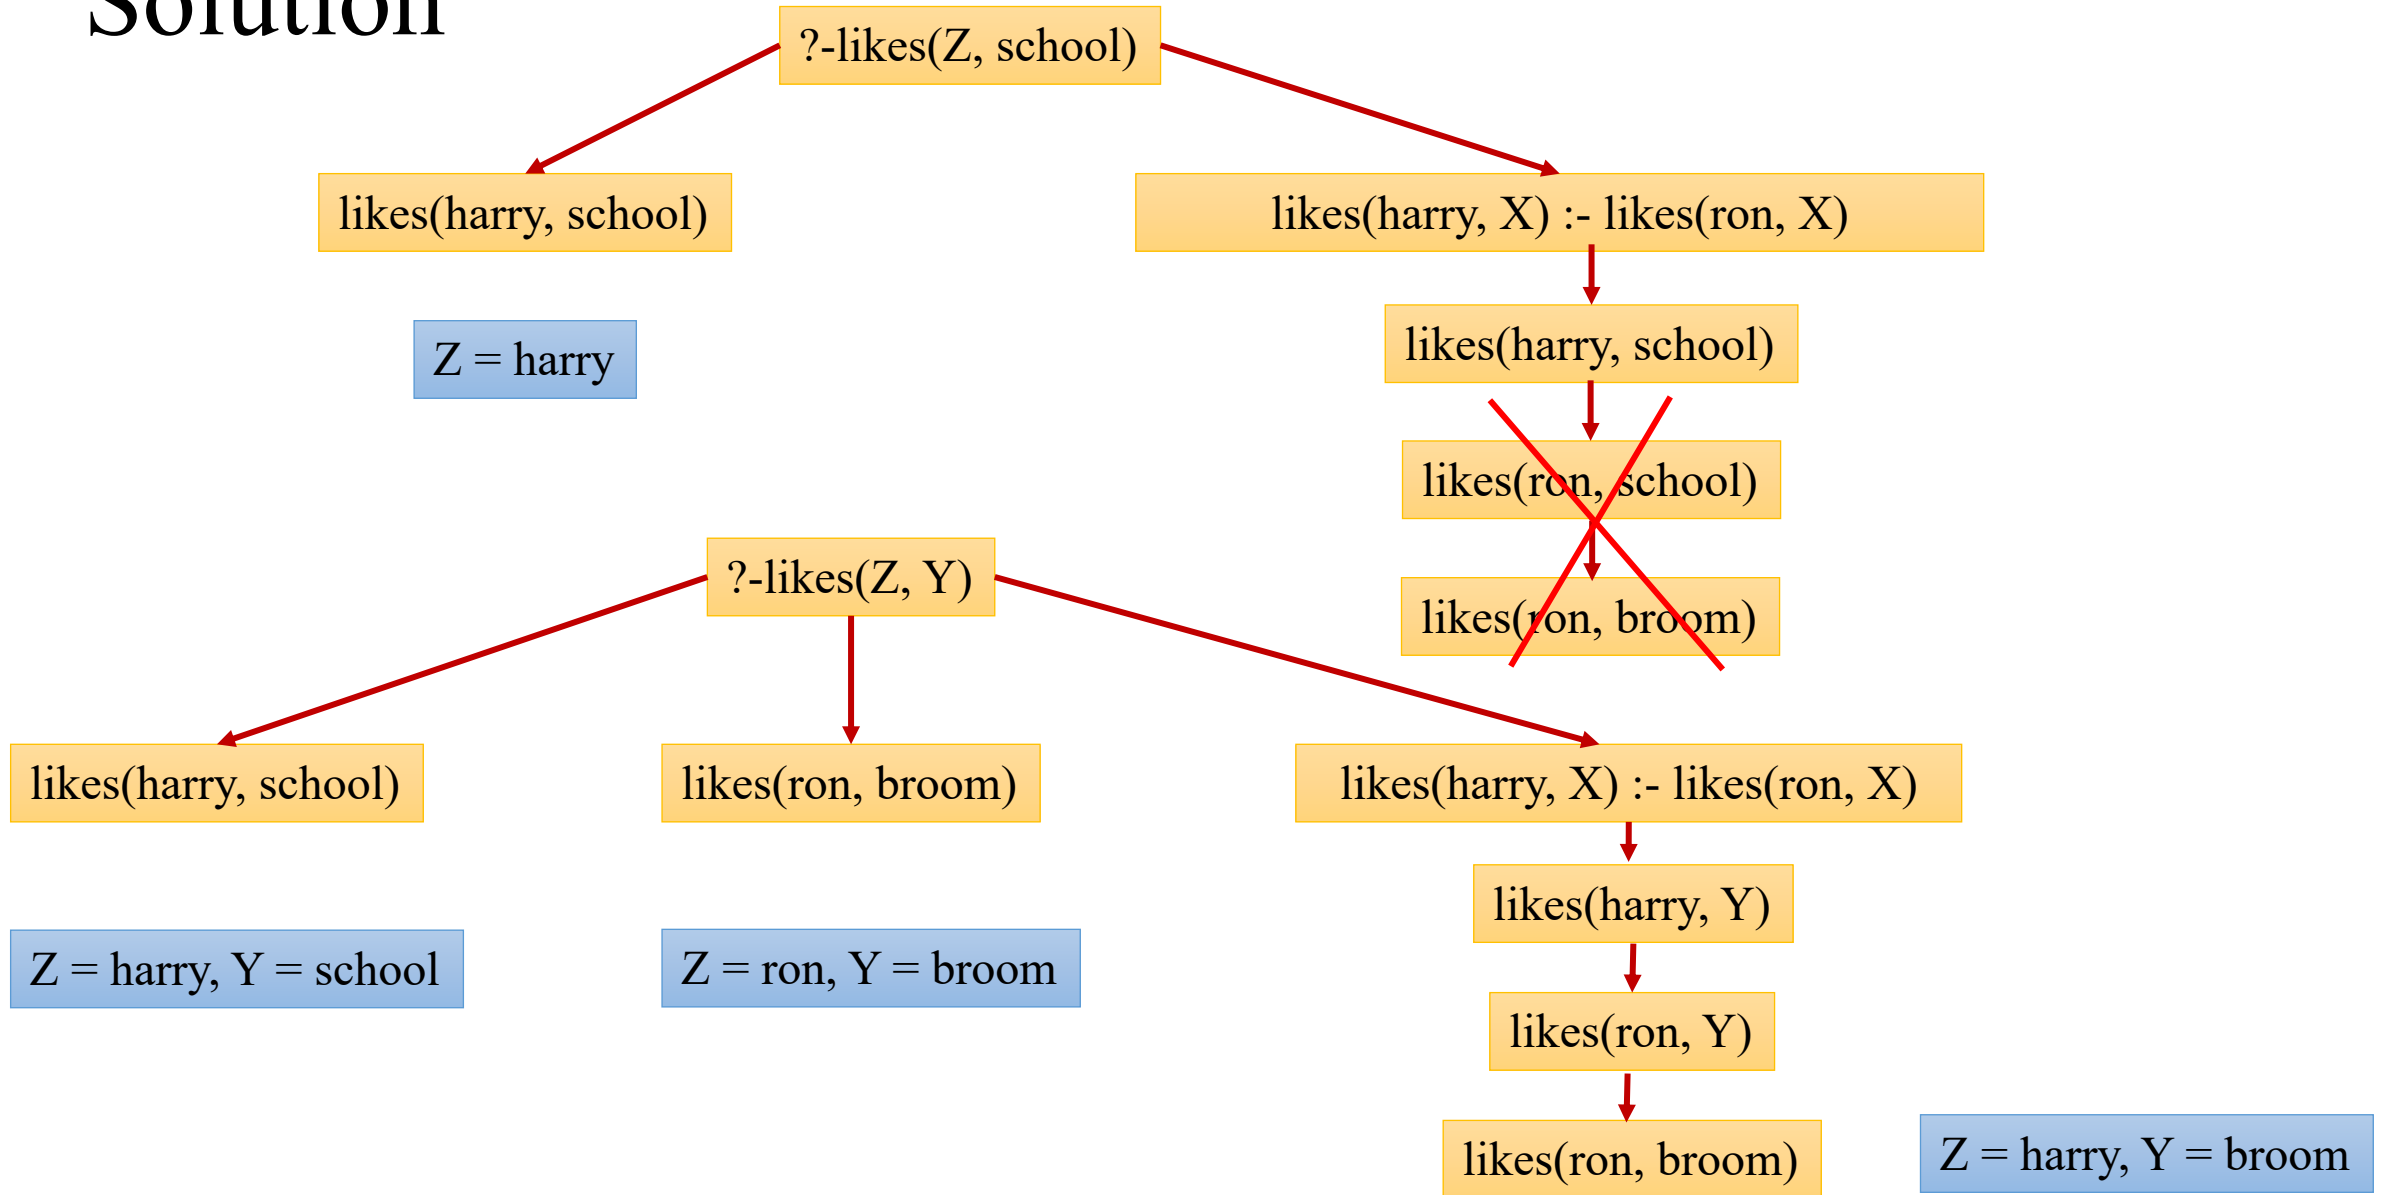

- ?-likes(harry, broom)
 - likes(harry, X) :- likes(ron, X)
 - likes(ron, broom)
- ?-likes(harry, Y)
 - Prolog will identify all possible instantiations of Y that satisfies likes(harry, Y)

Processing Sequence

- Prolog processes the facts and rules in sequential order
- Put the base condition always has to be specified high up in the order, so that it first tries the base condition, then recursion

Solution

Thank You
